

Request Fortify software, training, and support [HERE](#)

Self-Paced Fortify Training Available

This week's Secure Coding Tip is a reminder about the availability of self-paced Fortify Training. This training is provided by the VA Software Assurance Program Office and focuses on how to use the HPE Fortify Static Code Analyzer (SCA) tool.

The tool supports C/C++, .NET languages, Java, Objective-C, and other programming languages, with the exception of MUMPS and Delphi. Scanning source code for potential vulnerabilities is an authorization requirement enforced as part of the ATO issuance process.
