Introduction to Fortify Static Code Analyzer

June 17, 2014: 10:00 a.m. – 11:30 a.m. ET

Privacy and security is a growing concern with today's technology. As technology becomes more mobile, everyone wants to know how to protect their information. VA now requires "scanning" of all mobile software for security vulnerabilities and risks while it is in development. Join My VeHU Campus and the VHA OIA Connected Health WMS team as we show how the VA is addressing those security risks, and get an orientation on VA's use of the Fortify Static Code Analyzer from HP Enterprise Security Products to protect against security vulnerabilities in mobile software applications. You will gain an understanding of the connection between Fortify and Java and see how security is built into mobile applications during the development process.

Audience: All VA Staff
